Attack Surface Management Managed Service Overview

Cygienic's Attack Surface Managed Services provide an essential layer of defense for organizations with external web-facing servers.

By continuously monitoring and assessing the digital perimeter, we ensure that vulnerabilities and potential attack points are identified and addressed promptly.

Our proactive approach is crucial in mitigating threats before they can be exploited, safeguarding your critical assets and customer data.

Our team employs advanced algorithms and scanning techniques to meticulously scrutinize your web-facing servers. This thorough examination enables us to detect and counteract emerging threats, helping you stay one step ahead of malicious actors.

With Cygienic's Attack Surface Managed Services, you can fortify your cybersecurity posture and enhance your organization's resilience against the evolving landscape of cyber threats.

“This service is the cornerstone of our cybersecurity strategy. It provides unparalleled near-time risk data and peace of mind in today's ever-evolving threat landscape.”

-Singapore IT Consultant

“Cygienic’s unmatched expertise and cutting-edge technology provide a level of insights that every business needs in today's digital landscape.”

-Singapore Hotel

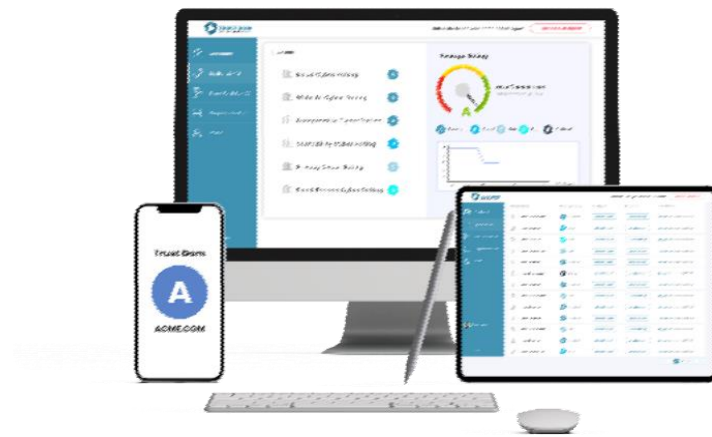

Attack Surface Management

Scope of Work

Cygenic's Attack Surface Management service follows a well-structured process, from client onboarding to remediation advisory reports, to ensure comprehensive cybersecurity. The stages can be summarized as follows:

1. **Client Onboarding:** The process begins with client onboarding, where Cygenic collaborates closely with your organization to gather essential information about your web-facing servers, digital assets, and specific concerns.
2. **Discovery and Assessment:** The next step involves a comprehensive scan of your external web-facing servers. Cygenic utilizes advanced algorithms to search the surface for potential vulnerabilities and threat indicators. This in-depth assessment uncovers potential risks and weaknesses.
3. **Threat Identification:** Once the initial assessment is complete, Cygenic identifies potential threats and vulnerabilities within your digital perimeter. Our experts analyze the data to differentiate genuine risks from false positives, ensuring that the focus remains on critical issues that require attention.
4. **Remediation Recommendations:** After pinpointing vulnerabilities, Cygenic generates detailed remediation recommendations.
5. **Ongoing Monitoring:** We continue to monitor your external web-facing servers to ensure the effectiveness of implemented measures. This ongoing vigilance is critical in identifying and addressing new threats that may emerge.
6. **Periodic Advisory Reports:** Cygenic provides regular advisory reports summarizing the status of your attack surface management. These reports offer insights into the current threat landscape, the progress of remediation efforts, and recommendations for further security enhancements. Our advisory reports keep you informed and guide you in maintaining a robust cybersecurity posture.

Cygienic's Attack Surface Management service offers a holistic approach to safeguarding your organization's digital assets. From the initial client onboarding to the ongoing monitoring and advisory reports, we ensure that your cybersecurity remains resilient and responsive to evolving threats.
